

WHAT IS CLAIMED IS:

1. An information processing apparatus which can communicate through a network with each of a plurality of information processing apparatuses connected to said network, comprising:

display means for displaying an icon indicative of each of said plurality of information processing apparatuses onto a virtual system display screen;

said virtual system display screen graphically displaying connecting states of said plurality of information processing apparatuses and peripherals locally connected to each of said information processing apparatuses;

obtaining means for obtaining information of the peripherals locally connected to said information processing apparatus from each of said plurality of information processing apparatuses;

first control means for displaying icons indicative of the peripherals locally connected to said information processing apparatus corresponding to the icon as a target of a user action in response to said user action for the icon of the information processing apparatus on said virtual system display screen on the basis of the information obtained by said obtaining means; and

second control means for calculating display positions of the icons which have already been

09671161.092800

displayed on said virtual system display screen on the basis of a display space of the icon of the peripheral which is newly displayed on said virtual system display screen by said first control means.

5

2. An apparatus according to claim 1, wherein said user action includes a first user action for selecting the icon of the information processing apparatus on said virtual system display screen by a pointing device.

10

3. An apparatus according to claim 1, wherein said user action includes a second user action for selecting the icon of the information processing apparatus on said virtual system display screen by a pointing device and selecting the icon of the peripheral locally connected to said information processing apparatus different from the information processing apparatus corresponding to said icon.

15

20

4. An apparatus according to claim 3, wherein said first control means further comprises discriminating means for discriminating whether the icon of the peripheral locally connected to said information processing apparatus selected by said second user action is displayed on said virtual system display screen or not on the basis of attributes of the

25

09671161.092800

peripheral corresponding to the icon selected by said second user action,

and only the icon of the peripheral in which a discrimination result by said discriminating means
5 indicates an affirmative decision is displayed.

5. An apparatus according to claim 4, wherein said discriminating means outputs an affirmative decision with respect to the peripheral which can
10 operate in an interlocking relational manner with the peripheral corresponding to the icon selected by said second user action.

6. An apparatus according to claim 5, wherein
15 said discriminating means executes the discrimination on the basis of a reference such that the peripheral having an image input function and the peripheral having an image transmitting function can operate in an interlocking relational manner.

20 7. An apparatus according to claim 5, wherein said discriminating means executes the discrimination on the basis of a reference such that the peripheral having an image input function and the peripheral
25 having an image printing function can operate in an interlocking relational manner.

09671151.092300

8. A data processing method in an information processing apparatus which can communicate through a network with each of a plurality of information processing apparatuses connected to said network, comprising:

a display step of displaying an icon indicative of each of said plurality of information processing apparatuses onto a virtual system display screen;

said virtual system display screen graphically displaying connecting states of said plurality of information processing apparatuses and peripherals locally connected to each of said information processing apparatuses;

an obtaining step of obtaining information of the peripherals locally connected to said information processing apparatus from each of said plurality of information processing apparatuses;

a first control step of displaying icons indicative of the peripherals locally connected to said information processing apparatus corresponding to the icon as a target of a user action in response to said user action for the icon of the information processing apparatus on said virtual system display screen on the basis of the information obtained by said obtaining step; and

a second control step of calculating display positions of the icons which have already been

09671151.092800

displayed on said virtual system display screen on the basis of a display space of the icon of the peripheral which is newly displayed on said virtual system display screen by said first control step.

5

9. A method according to claim 8, wherein said user action includes a first user action for selecting the icon of the information processing apparatus on said virtual system display screen by a pointing device.

10

10. A method according to claim 8, wherein said user action includes a second user action for selecting the icon of the information processing apparatus on said virtual system display screen by a pointing device and selecting the icon of the peripheral locally connected to said information processing apparatus different from the information processing apparatus corresponding to said icon.

15

20

11. A method according to claim 10, wherein said first control step further comprises a discriminating step of discriminating whether the icon of the peripheral locally connected to said information processing apparatus selected by said second user action is displayed on said virtual system display screen or not on the basis of attributes of the

25

09671161.092800

peripheral corresponding to the icon selected by said second user action,

and only the icon of the peripheral in which a discrimination result by said discriminating step
5 indicates an affirmative decision is displayed.

12. A method according to claim 11, wherein in said discriminating step, an affirmative decision is outputted with respect to the peripheral which can
10 operate in an interlocking relational manner with the peripheral corresponding to the icon selected by said second user action.

13. A method according to claim 12, wherein in
15 said discriminating step, the discrimination is executed on the basis of a reference such that the peripheral having an image input function and the peripheral having an image transmitting function can operate in an interlocking relational manner.

20 14. A method according to claim 12, wherein in said discriminating step, the discrimination is executed on the basis of a reference such that the peripheral having an image input function and the
25 peripheral having an image printing function can operate in an interlocking relational manner.

09671161.092800

15. A computer-readable memory which stores a computer program which is executed by a computer of an information processing apparatus which can communicate through a network with each of a plurality of information processing apparatuses connected to said network, wherein said computer program comprises:

a display step of displaying an icon indicative of each of said plurality of information processing apparatuses onto a virtual system display screen;

said virtual system display screen graphically displaying connecting states of said plurality of information processing apparatuses and peripherals locally connected to each of said information processing apparatuses;

an obtaining step of obtaining information of the peripherals locally connected to said information processing apparatus from each of said plurality of information processing apparatuses;

a first control step of displaying icons indicative of the peripherals locally connected to said information processing apparatus corresponding to the icon as a target of a user action in response to said user action for the icon of the information processing apparatus on said virtual system display screen on the basis of the information obtained by said obtaining step; and

a second control step of calculating display

09671161.092800

positions of the icons which have already been
displayed on said virtual system display screen on the
basis of a display space of the icon of the peripheral
which is newly displayed on said virtual system display
5 screen by said first control step.

16. A memory according to claim 15, wherein said
user action includes a first user action for selecting
the icon of the information processing apparatus on
10 said virtual system display screen by a pointing
device.

17. A memory according to claim 15, wherein said
user action includes a second user action for selecting
15 the icon of the information processing apparatus on
said virtual system display screen by a pointing device
and selecting the icon of the peripheral locally
connected to said information processing apparatus
different from the information processing apparatus
20 corresponding to said icon.

18. A memory according to claim 17, wherein said
first control step further comprises a discriminating
step of discriminating whether the icon of the
25 peripheral locally connected to said information
processing apparatus selected by said second user
action is displayed on said virtual system display

008260" T9TT 2960

screen or not on the basis of attributes of the peripheral corresponding to the icon selected by said second user action,

5 and only the icon of the peripheral in which a discrimination result by said discriminating step indicates an affirmative decision is displayed.

10 19. A memory according to claim 18, wherein in said discriminating step, an affirmative decision is outputted with respect to the peripheral which can operate in an interlocking relational manner with the peripheral corresponding to the icon selected by said second user action.

15 20. A memory according to claim 19, wherein in said discriminating step, the discrimination is executed on the basis of a reference such that the peripheral having an image input function and the peripheral having an image transmitting function can
20 operate in an interlocking relational manner.

25 21. A memory according to claim 19, wherein in said discriminating step, the discrimination is executed on the basis of a reference such that the peripheral having an image input function and the peripheral having an image printing function can operate in an interlocking relational manner.
